

TradeVoice: real-world validation

NAIC 2026, Innovation and Enterprise track, PS2 Voice-First Access. Live build:
<https://tradevoice.duckdns.org>

This document has two parts. The **numbers** come from the live app's own log, as one page with charts. The **people part** (who tested it, what they said) comes from the team. Together they make the "Real-world validation" PDF.

1. The numbers: make the report (5 minutes)

On the server (after `ssh`):

```
sudo bash /opt/tradevoice/app/deploy/server/validation_report.sh
```

It saves `validation.html` in your home folder. For another window of days, add `--start 2026-10-06 -end 2026-10-17`.

On your Mac:

```
scp -i ~/Downloads/tradevoice-key.pem ubuntu@54.170.27.207:validation.html ~/Desktop/
```

Then open it in Chrome and choose Print, then Save as PDF.

What the report shows (counts only; the log never holds names, phone numbers, amounts or words; the team's own phones in `TEAM_PHONES` are left out):

- traders who used it and new sign-ups;
- conversations per day, where they happened (live talk, Ask chat, voice question, Telegram) and in which language;
- records saved, customers added, voice notes heard and notebook photos read;
- which AI understood them: the share answered by N-ATLaS, and how often a backup answered;
- which model heard their voice;
- the funnel: opened the app, signed up, saved a record, came back another day;
- how long each step took;
- what went wrong, and what we changed during the pilot.

2. How the pilot ran

[Fill in: dates, where (markets, cities), how traders were found, how many, which languages they used.]

Consent:

- Each trader agreed to the terms in the app before anything was processed.
- A separate question asked whether TradeVoice may keep their voice notes, photos and chats to improve it. Only traders who said yes had anything kept.

- [Fill in: how consent was explained in person, and in which language.]

Channels:

- **The web app** (on any phone browser) was the main way in.
- **Telegram** was offered to traders who use it.
- **WhatsApp**: the bot is built and tested, but was not live, because the team could not get WhatsApp Business API access in time.

3. External beta testers (at least 2, outside the team)

Name	Role	Date	What they tested	Confirmation
[name]	[e.g. shop owner, Ikeja]	[date]	[e.g. recorded sales by voice in Yorùbá, asked who owes them]	[signed note / voice note / message, kept privately]
[name]	[role]	[date]	[what]	[how]

Keep the confirmations themselves out of GitHub. They contain personal details.

4. What traders said

[3 to 5 short quotes, with permission, first name or role only. For example: "Market trader, Hausa: ..."]

5. What went wrong and what we fixed

From the report's last two sections, plus anything traders told you. Be plain about what still doesn't work well.

[Fill in.]

6. Honest limits of this evidence

- **Size and selection**: the pilot was small and short, and the traders were found through the team's contacts.
- **Language check**: the Yorùbá, Hausa and Igbo test sentences in `eval/` were written by the team, not checked by native speakers.
- **Voice in noise**: the before-and-after test on real market notes is not done yet. The script is ready (`deploy/server/speech_ab.sh`).

N-ATLaS is an initiative of the Federal Ministry of Communications, Innovation and Digital Economy, and powered by Awarri Technologies.
